## 1. INTRODUCTION

### 1.1. General

Kumpulan IKRAM Sdn Bhd (hereinafter referred to as “IKRAM”) was commissioned by Jabatan Kerja Raya (hereinafter referred to as “JKR”) to provide an independent design review and rehabilitation proposal for eight (8) nos. of pier which were reported cracks by JKR at viaduct on Federal Route FT180/001/40 West Port – North Port, Selangor.

Table 1. List of Affected Piers

PIER		PIER Type
ID	DES	
P-10A	Inverted "L"	P1-C
P-11A	Inverted "L"	P1-C
P-12A	Inverted "L"	P1-C
P-13B	Inverted "L"	P1-C
P-14B	Inverted "L"	P1-C
P-15B	Inverted "L"	P1-C
P-25	"T"	P1-A
P-33	"T"	P1-A

The scope of work includes the following:-

- To carry out independent design review on the affected pier and crosshead structures which were designed and built in 1999 in accordance with the design version of bridge design codes i.e. BS 5400 and BD 37/88;
- To carry out detailed condition surveys, crack mappings and material testing on the affected piers;
- To propose rehabilitation or strengthening work design for the affected piers and crosshead.

## 1.2. Scope Of This Document

This document presents the assumptions, methodology and results of the independent design review. The desk-top study is based on the as-built drawings, design basis and information made available at the time for this design review. Three (3) piers, namely P11a, P25 and P33 have been selected for this design review.

## 2. REFERENCE DOCUMENTS, UNITS and ABBREVIATIONS

### 2.1. Design Codes and Standards

BS 5400-4:1990 – Part 4: Code of Practice for design of concrete bridges

Departmental Standard BD 37/88 – Loads for Highway Bridges

### 2.2. Design References

*Ref #1: Strut-and-Tie Model for Deep Beam Design – A practical exercise using Appendix A of the 2002 ACI Building Code, James K. Wight and Gustavo J. Parra-Montesinos*

*Ref #2: Building Code Requirements for Structural Concrete (ACI 318-08) and Commentary. Appendix A – Strut-and-Tie Models*

### 2.3. System of Units

The following units are used in the report presentation;

- *Length = m*
- *Tension / Compression Force = kN*
- *Tension / Compression Stress = N/mm<sup>2</sup>*
- *Bending Moment = kN.m*
- *Shear Force = kN*
- *Section Ultimate Capacity (Bending) = kN.m*
- *Section Ultimate Capacity (Axial) = kN*
- *Crack Width = mm*
- *Reinforcement Area = mm<sup>2</sup>*

## **2.4. Abbreviations**

The following abbreviations are used in the report presentation;

- *FEM – Finite Element Model*
- *IKRAM - Kumpulan Ikram Sdn Bhd*
- *JKR – Jabatan Kerja Raya*
- *KEL – Knife Edge Load*
- *LHS – Left Hand Side*
- *MTAL – Medium Term Assessment Loading*
- *RHS – Right Hand Side*
- *STM – Strut and Tie Model*
- *SLS – Serviceability Limit State*
- *UDL – Uniform Distributed Load*
- *ULS – Ultimate Limit State*

### 3. INFORMATIONS SUPPLIED

The following reports and as-built drawings are made available for this study

#### 3.1. Reports

*RPT #1:* “Laporan Pemeriksaan 8 Bilangan ‘Pier’ dan ‘Crosshead’ Jejambat FT180/001/40 di Laluan Pelabuhan Barat – Pelabuhan Utara, Daerah Klang, Selangor” by Bahagian Forensik (Struktur & Jambatan) Cawangan Kejuruteraan Awam, Struktur & Jambatan, Ibu Pejabat JKR Malaysia dated 22nd October 2010

#### 3.2. As Built Drawings

Table 2. List of As Built Drawings

Item	Drawing Title	Drawing No.
1	Typical Cross Section From CH360 to CH550	KPKR/J/R/129653/1/AM13
2	Typical Cross Section From CH720 to CH850	KPKR/J/R/129653/1/AM15

17	Standard Expansion Joints	KPKR/J/R/129653/1/ST13A

## 4. DESIGN REVIEW METHODOLOGY

### 4.1. Approach

There are eight (8) piers which were reported cracks by JKR. The details of the affected structures are summarized as below:-

Table 3. The Affected Pier Information ( 8 Nos.)

PIER		Pier Type	Pier dia. (m)	Cross-head Depth (m)	Piling	SPAN LENGTH / PRECAST BEAM TYPE	
ID	TYPE					LHS (m)	RHS (m)
P-10A	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-11A	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-12A	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-13B	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	28.17m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.85m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-14B	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	21.85m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.83m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-15B	Inverted "L"	P1-C	2.5	2.5	4- Ø1200	21.83m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.78m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M
P-25	"T"	P1-A	3.0	3.5	6- Ø1200	35.05m / 12 <sup>n</sup> -U	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M
P-33	"T"	P1-A	3.0	3.5	6- Ø1200	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M

After examining their span configuration and structural form, P-11A, P-25 and P-33 have been selected for this review study.

Based on the as built drawings and design basis / criteria made available for this study, 3D analytical models were built for P-11A, P-25 and P-33 to investigate the maximum induced forces acting on the affected piers and crossheads. The forces are checked against two (2) limit stage conditions; Serviceability Limit State (SLS) and Ultimate Limit State (ULS). The sectional axial and bending capacities are computed and checked against the maximum forces from the analysis under ULS condition. The crack widths are computed based on the maximum force from the analysis under SLS condition.

Strut and Tie models (STM) and Finite Element Analysis (FEM) are performed to investigate the tension tie forces and localized tensile stresses distribution of the crossheads.

## 4.2. Loading

The following loads have been considered in this design review.

- Dead load
- Superimposed dead load
- Traffic live loads
- Wind load

### 4.2.1 Dead Load

Unit weight of precast post tensioned girder and in-situ deck slab is taken as  $25.0\text{kN/m}^3$ .

- Precast M10 girder =  $11.42\text{kN/m}$
- Precast UM10 girder =  $13.58\text{kN/m}$
- Precast “U” girder =  $18.66\text{kN/m}$  (for left span of P25 only)
- 160mm in-situ deck slab =  $3.84\text{kN/m}^2$

### 4.2.2 Superimposed Dead Load (SDL)

Unit weight of secondary RC element is taken as  $24.0\text{kN/m}^3$  and premix is taken as  $22.6\text{kN/m}^3$ .

- 50mm premix =  $1.13\text{kN/m}^2$
- RC Parapet =  $5.88\text{kN/m}$  (Edge)  
=  $11.75\text{kN/m}$  (Central)

### 4.2.3 Traffic Live Load

Traffic live loads adopted for the study are as follows:-

- $HA_{UDL} + KEL$
- $HA_{UDL} + 30$  units HB (BD 37/88 cl. 6.3)
- 45 units HB (Unguided)
- JKR SV20 (Guided along centerline of carriageway)
- JKR Medium Term Axle Load (MTAL)

The traffic live loads used in accordance with BD 37/88 for 3 notional lanes are as follows:-

Figure 1. Typical section of bridge deck

Table 4. BD 37/88 (3 Notional Lanes) Vehicular Load Tabulation

Pier Type	Carriageway Width (m)	Notional Lane Width (m)	Loaded Length (m)	ULD (per lane)		KEL (kN)
				kN/m	kN/m <sup>2</sup>	
P1-C (P-11A)	8.00	2.667	28.0	36.04	13.52	120.0
P1-A (P-25 Left)	7.85	2.617	35.0	31.03	11.86	120.0
P1-A (P-25 Right)	7.85	2.617	28.0	36.04	13.77	120.0
P1-A (P-33)	7.85	2.617	28.0	36.04	13.77	120.0

In accordance with cl. 3.2.9.1 of BD 37/88, “In the absence of raised kerbs it is the width between safety fences, less the amount of set-back required for these fences, being not less than 0.6m or more than 1.0m from the traffic face of each fence”. Based on this clause, a separate loading criterion is established for 2 notional lanes.

The traffic live load used in accordance with BD 37/88 for two (2) notional lanes is as follows:-

Figure 2. BD 37/88 (2 Notional Lanes) configuration

Table 5. BD 37/88 (2 Notional Lanes) load distribution

Pier Type	Carriageway Width (m)	Notional Lane Width (m)	Loaded Length (m)	ULD (per lane)		KEL (kN)
				kN/m	kN/m <sup>2</sup>	
P1-C (P-11A)	6.80	3.400	28.0	36.04	10.60	120.0

The traffic live load used in accordance with JKR MTAL for three (3) fixed 2.5m wide notional lanes is as follows:-

Table 6. JKR MTAL (3 Notional Lanes) load distribution

Pier Type	Carriageway Width (m)	Notional Lane Width (m)	Loaded Length (m)	ULD (per lane)		KEL (kN)
				kN/m	kN/m <sup>2</sup>	
P1-C (P-11A)	8.00	2.500	28.0	27.00	10.80	100.0

\*Remaining 0.5m width loaded with 5.0 kN/m<sup>2</sup>

The following Table (7) summarized types of the traffic live load applied in this study.

Table 7. Summary of traffic live load analysis

Pier Type	BD 37/88		SV20	JKR MTAL (3 Notional Lanes)
	3 Notional Lanes	2 Notional Lanes		
P1-C (P-11A)	√	√	√	√
P1-A (P-25)	√		√	
P1-A (P-33)	√		√	

#### 4.2.4 Wind Load

Transverse wind load is checked against Pier P-11A. The nominal transverse wind load is derived based on a maximum 3-sec wind gust speed of 32 m/s.

### 4.3. Material Strength

#### 4.3.1 Concrete

Concrete grade adopted for the study are as follows;

- Precast post tensioned beams = C50
- Reinforced concrete crossheads & piers = C40

#### 4.3.2 Reinforcement

Reinforcement bar adopted for the study is Type 2 deformed bar with minimum yield strength,  $f_y = 460\text{N/mm}^2$ .

#### 4.4. Load Combinations

The applied load factors  $\gamma_{fl}$  and  $\gamma_{f3}$  for SLS and ULS shall be as follows:-

Table 8. SLS and ULS load factors

No.	Load Case	Combination 1		$\gamma_{f3}$	ULS
		$\gamma_{fL}$			
		SLS	ULS		
1	SW	1.00	1.15	1.10	
2	Deck Slab	1.00	1.15	1.10	
3	SDL (Parapet)	1.00	1.20	1.10	
4	Premix	1.20	1.75	1.10	
5	HA+KEL	1.20	1.50	1.10	
6	HA+HB30	1.10	1.30	1.10	
7	HB45	1.10	1.30	1.10	
8	SV20	1.10	1.30	1.10	
9	MTAL	1.20	1.50	1.10	

#### 4.5. Ultimate Limit State (ULS) - Sectional Capacity Check

The ultimate capacity for the affected piers and crossheads are computed based on the as-built drawings made available for this study. These capacities are checked against the maximum load effects acting on the pier in Ultimate Limit State (ULS) to assess the adequacy of the design.

#### 4.6. Serviceability Limit State (SLS) - Crack Width Check

The crack width for the affected piers and crossheads are computed based on the as-built drawings made available for this study. The crack widths are checked using the maximum force derived from load case HA+KEL in Serviceability Limit State (SLS). The allowable crack width shall be less than 0.25mm in accordance with *BS 5400 cl. 4.1.1.1*.

Table 9. BS 5400-4:1990 "Table 1 – Design Crack Widths (*cl. 4.1.1.1*)

<i>Severe</i> Concrete surfaces exposed to: driving rain or alternate wetting and drying	Wall and structure supports remote from the carriageway Bridge deck soffits Buried parts of structures	0.25
--	--	------

## 5. DESCRIPTION OF STRUCTURES

Based on the as-built information made available for this study, the basic data of the affected piers and crossheads used for the analysis are summarized as follows;

Table 10. Pier description and configuration

PIER		Pier Type	Pier dia. (m)	Cross-head Depth (m)	Piling	SPAN LENGTH / PRECAST BEAM TYPE		H (m)	
ID	TYPE					LHS (m)	RHS (m)		
P-10A	Inverted "L"	P1-C	2.5	2.5	4-Ø1200	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	10.451	EJ

P-12A	Inverted "L"	P1-C	2.5	2.5	4-Ø1200	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	10.497	Fixed
P-13B	Inverted "L"	P1-C	2.5	2.5	4-Ø1200	28.17m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.85m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	11.087	
P-14B	Inverted "L"	P1-C	2.5	2.5	4-Ø1200	21.85m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.83m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	11.087	EJ
P-15B	Inverted "L"	P1-C	2.5	2.5	4-Ø1200	21.83m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	21.78m / 2 <sup>n</sup> -UM + 6 <sup>n</sup> -M	10.573	
P-25	"T"	P1-A	3.0	3.5	6-Ø1200	35.05m / 12 <sup>n</sup> -U	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M	8.961	EJ
P-33	"T"	P1-A	3.0	3.5	6-Ø1200	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M	28.05m / 2 <sup>n</sup> -UM + 14 <sup>n</sup> -M	8.961	EJ

The working capacity of the Ø1200mm bored pile is 6,000kN.

After examining the span configuration and structural form for the eight (8) cracked piers, P-11A, P-25 and P-33 have been selected for this review study.

### 5.1. Pier P-11A (Type P1-C)

P-11A is an inverted "L" shape pier supporting 28.05m long precast girders on the left and right. Each span consists of 6 nos. of precast M10 girder and 2 nos. of precast UM10 edge girder and supported by 4 nos. of 1200mm dia. bored pile. The working capacity of the 1200mm dia. bored pile is 6,000kN.

Figure 3. Pier P-11A (Type P1-C)

Figure 4. Pier P-11A (Type P1-C) precast beam

## 5.2. Pier P-25 (Type P1-A)

P-25 is a "T" shape pier supporting 35.05m span on the left and 28.05m span on the right. The left span consists of 12 nos. of precast U girder and the right span consists of 14 nos. of precast M10 girder and 2 nos. of precast UM10 edge girder and supported by 6 nos. of 1200mm dia. bored pile. The working capacity of the 1200mm dia. bored pile is 6,000kN.

Figure 5. Pier P-25 (Type P1-A) – Left span

Figure 6. Pier P-25 (Type P1-A) – Right span

Figure 7. Pier P-25 (Type P1-A) precast beam section properties

### 5.3. Pier P-33 (Type P1-A)

P-33 is a “T” shape pier supporting 28.05m span on the left and right. Each span consists of 14 nos. of precast M10 beam and 2 nos. of precast UM10 beam and supported by 6 nos. of 1200mm dia. bored pile. The working capacity of the 1200mm dia. bored pile is 6,000kN.

## **6. 3D ANALYTICAL MODELS**

### **6.1. Description of Analytical Model**

- a) 3D analytical models are established using analysis software StaadPro 2007 to determine the maximum combined load effects on the affected piers and crossheads under the service load conditions.

Three (3) independent models are built for this study, i.e;

- P-11A (Type P1-C) – Inverted “L” shape pier
- P-25 (Type P1-A) – “T” shape pier
- P-33 (Type P1-A) – “T” shape pier

- b) 2D STM's (Strut and Tie Model) are built to check the shear critical structure or the D-regions of deep hammer pier type concrete structure.

Two (2) independent STM models are built for this study, i.e;

- P-11A (Type P1-C) – Inverted “L” shape pier
- P-33 (Type P1-A) – “T” shape pier

- c) 2D FEM's (Finite Element Model) are performed to investigate the localized stresses on the piers and crossheads.

Two (2) independent FEM models are built for this study, i.e;

- P-11A (Type P1-C) – Inverted “L” shape pier
- P-33 (Type P1-A) – “T” shape pier

## 7. DESIGN REVIEW FOR PIER P-11A (TYPE P1-C)

From the 3D analysis, the load effects under each load case can be obtained for P-11A.

### 7.1. Pier Column Check for Pier P-11A

The member forces for pier column are presented below for various load combinations. The design checks for pier column members under ULS and SLS are performed.

#### 7.1.1 Analysis Results for Pier P-11A Column

The maximum design forces at pier column base are tabulated.

##### 7.1.1.1 BD 37/88 (3 Notional Lanes)

Table 11. P-11A pier force – BD 37/88 (3 Notional Lanes)

### 7.1.2 Sectional Capacity Check (ULS) for P-11A Column

The pier section capacity is calculated based on the following as-built parameters;

- $\varnothing 2500\text{mm}$ ,  $f_{cu}=40\text{MPa}$ , 50-T32

From the following design checks, all the applied ULS forces lies within the P-M interaction capacity envelope; hence it can be conclude that the existing design of pier column P-11A is adequate at ULS.

### 7.1.2.1 BD 37/88 (3 Notional Lanes)

#### Ultimate Section Capacity BS5400

##### Design Information:

PIER P11A TYPE P1 -C (3 Notional Lanes)

$f_{cu}$	40	N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$	3.10E+07	kN/m <sup>2</sup>	: Modulus of elasticity of concrete; short term
$f_y$	460	N/mm <sup>2</sup>	: Yield strength
$E_s$	2.00E+08	kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$Y_{cg}$	1250.000	mm	: Centroid of section
$\Sigma A_g$	4,872,930	mm <sup>2</sup>	: Area of concrete section
$\Sigma A_s$	40,212	mm <sup>2</sup>	: Area of Rebars
$\Sigma A_p$	-	mm <sup>2</sup>	: Area of prestressing strand
$A_s/A_g$	0.83	%	
$A_p/A_g$	0.00	%	
$P_{u,max}$	90,360	kN	: $0.4f_{cu}A_g + 0.67f_yA_s$

##### Neutral Axis

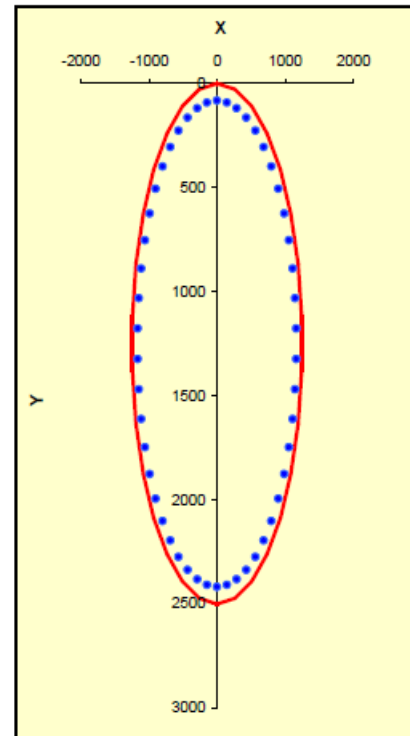

Neutral Axis,  $Y_n$ , where  $\Sigma(F_c + F_p + F_s + P_u) = 0$

$\Sigma A_c$	4,800,834	mm <sup>2</sup>	: Area of concrete in compression
$F_c$	-76,813	kN	: Force on concrete
$F_s$	-9,029	kN	: Force on rebars
$F_p$	0	kN	: Force on prestressing strands
$Err(x)$	1.306E-03		: $Err(Y_n) = \Sigma(F_c + F_s + F_p + P_u)$

$Y_n = 2389.04$  mm

$P_u$	85,842	kN	: Ultimate Axial Force (+) compression
$M_u$	8,274	kN-m	: Ultimate Bending Capacity

##### P-M PLOT

#### 7.1.2.4 Transverse Wind Load for P-11A Column

It is found that the ultimate pier induced force for Load Combination (2) under transverse wind load condition is less critical compared to Load Combination (1). Therefore, no further check would be required.

#### 7.1.3 Crack Width Check (SLS) for P-11A Column

The pier crack width is calculated based on the following as-built parameters

Ø2500mm,  $f_{cu}=40\text{MPa}$ , 50-T32

From the following crack width checks, the computed crack widths for pier column P-11A (Type P1-C) are summarized as follows;

Table 19. Summary of P-11A SLS crack width check

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-C (P-11A)	<b>0.416</b>	<b>0.370</b>	<b>0.398</b>

Hence, the existing design of Pier P-11A exceeds the allowable crack width of 0.25mm for all 3 cases.

### 7.1.3.1 BD 37/88 (3 Notional Lanes)

## 7.2.2 Section Capacity Check (ULS) for P-11A Crosshead

The crosshead is checked for its moment and shear capacity under Ultimate Limit State (ULS).

The crosshead section capacity is calculated based on the following as-built information:-

### Crosshead P-11A (Type P1-C)

- Width = 2500mm, Depth = 2500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (2 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

### 7.2.2.1 Ultimate Moment Capacity Check for P-11A Crosshead

The computed crosshead ultimate moment capacities for Pier P-11A (Type P1-C) are computed and compared with the ULS applied moments.

Table 32. Summary of P-11A crosshead ULS moment capacity check

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	24,439	26,069	25,805	1.06
BD 37/88 (2 Notional Lanes)	24,439	26,069	24,442	1.00
JKR MTAL (3 Notional Lanes)	24,439	26,069	25,173	1.03

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The applied moments exceed the P-M interaction envelopes when the ultimate moment capacity is analyzed without taking into consideration the side reinforcement. However, when the side reinforcement is incorporated in the ultimate capacity calculation, the applied moments are within the P-M interaction envelope. Hence the existing crosshead moment capacity design for P-11a (Type P1-C) is marginally pass at ULS.

The detailed computations of the sectional moment capacities are presented below.

### 7.2.2.2 Ultimate Shear Capacity Check for P-11A Crosshead

The shear link required for crosshead of Pier P-11A (Type P1-C) under ULS is computed and compared to the shear link provided.

Table 33. Summary of P-11A crosshead ULS shear force capacity check

BD 37/88 (3 Notional Lanes) @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.72	8.04	0.96
ULS2C1	7.28	8.04	0.90
ULS3C1	6.96	8.04	0.87
ULS4C1	7.71	8.04	0.96

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

BD 37/88 (2 Notional Lanes) @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	6.90	8.04	0.86
ULS2C1	6.64	8.04	0.83
ULS3C1	6.94	8.04	0.86
ULS4C1	7.70	8.04	0.96

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

JKR MTAL @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.57	8.04	0.94

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

Based on the above, the shear link provided in the as-built drawings is more than the requirement. Hence, the existing crosshead shear design for P-11A (Type P1-C) is adequate at ULS.

The detailed computations of the sectional shear capacities are presented as below.

<b>Sufficient!</b>					

### 7.2.3 Crack Width Check (SLS) for Pier P-11A Crosshead

The crosshead crack width is calculated based on the following as-built parameters:-

#### Crosshead P-11A (Type P1-C)

- Width = 2500mm, Depth = 2500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (2 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

The computed crosshead crack widths for Pier P-11A (Type P1-C) are summarized as follows:-

Table 34. Summary of P-11A crosshead SLS crack width check

Loading Criteria	Crack Width (mm)	
	Without Sidebar	With Sidebar
BD 37/88 (3 Notional Lanes)	<b>0.270</b>	<b>0.255</b>
BD 37/88 (2 Notional Lanes)	0.196	0.181
JKR MTAL (3 Notional Lanes)	<b>0.252</b>	0.238

The computed crack widths for 3 notional lanes under BD37/88 and JKR MTAL loading criteria without taking side reinforcement into consideration are 0.270mm and 0.252mm, which exceed the allowable crack width of 0.250mm. When side reinforcement is incorporated into the design check, the computed crack width under BD 37/88 is 0.255mm which still exceeds the allowable limit. However, under JKR MTAL is 0.238mm which is less than the allowable limit.

Under BD 37/88 2 notional lanes criteria, both the design checks with and without side reinforcement are 0.181mm and 0.196mm respectively which are less than the allowable crack width of 0.250mm.

The detailed computation of the crack widths are presented below.

ULS4C1	(SW+Deck Slab+SDL+Premix) + (SV20)	1141	1133	1670	1499	1543	1365	1273	804

Note : N<sub>8</sub> is located at the tip of the cantilever (furthest from the pier)

Figure 32. P-11A STM Analysis Model

Figure 33. Pier P-11A Tension and Compression Zone based on ULS1C1

Figure 34. P-11A STM Axial Force Diagram (Blue = Tension, Red = Compression)

The support for the STM model is modelled based on the centroid of the tension reinforcement zone and concrete compression zone as shown in Figure 33.

The tie tension forces obtained from the analysis are checked as follows;

#### Top Tension Tie (104-105) Check

$$f_y = 460 \text{ Mpa}$$

$$A_{s,prov} = 27,336 \text{ mm}^2 \quad (2 \times 17T32 \text{ top reinforcement})$$

$$T_u = 9,190 \text{ kN}$$

$$A_{s,req} = T_u / 0.87f_y$$

$$= 22,964 \text{ mm}^2$$

Remarks :  $A_{s,prov} > A_{s,req}$  O.K!

#### Vertical Tension Tie (103-203) Check

$$f_y = 460 \text{ Mpa}$$

$$A_{s,prov} = 25,728 \text{ mm}^2 \quad (32T32 \text{ column main reinforcement inside } 1780\text{mm tension zone})$$

$$14,311 \text{ mm}^2 \quad (3T16-150 \text{ links in } 1780\text{mm tension zone})$$

$$\hline 40,039 \text{ mm}^2$$

$$T_u = 10,685 \text{ kN}$$

$$A_{s,req} = 26,700 \text{ mm}^2$$

Remarks :  $A_{s,prov} > A_{s,req}$  O.K!

**Vertical Tension Tie (105-205) Check**

$$\begin{array}{rcl} f_y & = & 460 \text{ Mpa} \\ A_{s,prov} & = & 0 \text{ mm}^2 \\ & & 8,040 \text{ mm}^2 \quad (3T16-150 \text{ links in } 1000\text{mm tension zone}) \\ \hline & & 8,040 \text{ mm}^2 \end{array}$$

$$\begin{array}{rcl} T_u & = & 3,666 \text{ kN} \\ A_{s,req} & = & 9,161 \text{ mm}^2 \\ \text{Remarks : } & A_{s,prov} < A_{s,req} & \text{ FAILED!} \end{array}$$

The check shows that the top reinforcement and column reinforcement in the tension zone provided are sufficient to cater for the tension forces. However, the shear links provided is insufficient to resist the tension forces.

The bottom compression strut forces obtained from the analysis are checked as follows;

**Bottom Compression Strut (204-205) Check**

$$\begin{array}{rcl} f_{cu} & = & 40 \text{ Mpa} \\ b & = & 2,500 \text{ mm} \quad (\text{Crosshead width}) \\ d & = & 680 \text{ mm} \quad (\text{Crosshead compression zone}) \\ \\ S_u & = & 7,673 \text{ kN} \\ \sigma & = & 4.51 \text{ Mpa} \\ \text{Remarks : } & < 0.4f_{cu} & \text{ O.K} \end{array}$$

Based on the check, the concrete stress calculated is  $4.51 \text{ N/mm}^2$ , which is less than  $0.4f_{cu}$ ;  $16.0 \text{ N/mm}^2$ . Thus, the bottom strut concrete compression stress is within the concrete strength limit.

The diagonal compression strut is checked as follows;

Figure 35. P-11A diagonal strut check

#### Diagonal Strut <sub>(103-204)</sub> Check based on ACI

##### Effective Compressive Strength for Node <sub>103</sub>

$$\begin{aligned}
 \beta_n &= 0.6 && \text{(CTT)} \\
 f'_c &= 40 && \text{Mpa} && \text{(cube strength)} \\
 &= 4,640 && \text{psi} \\
 f_{ce(103)} &= 0.85\beta_n f'_c && \text{(eq. A-8)} \\
 &= 2.37 && \text{ksi} \\
 &= 16.32 && \text{Mpa}
 \end{aligned}$$

##### Calculate Width of Tie <sub>103-104</sub>

$$\begin{aligned}
 \phi &= 0.85 && \text{(cl. C.9.3.2.6)} \\
 b_w &= 2,500 && \text{mm} \\
 &= 98.5 && \text{in.} \\
 F &= 8,937 && \text{kN} \\
 &= 2,009 && \text{k} \\
 W_{(103-104)} &= F / \phi(b_w)f_{cu} \\
 &= 10.1 && \text{in.} \\
 &= 257.6 && \text{mm}
 \end{aligned}$$

### Effective Compressive Strength for Strut 103-204

$$\begin{aligned}\beta_s &= 1.00 && (\text{cl. A.3.2.1}) \\ f'_c &= 40 \text{ Mpa} && (\text{cube strength}) \\ &= 4,640 \text{ psi} && (\text{cylinder strength}) \\ f_{ce(103-204)} &= 0.85\beta_s f'_c && (\text{eq. A-3}) \\ &= 3.94 \text{ ksi} \\ &= 27.20 \text{ Mpa}\end{aligned}$$

### Check Strut 103-204 Capacity

$$\begin{aligned}w_{s(103-204)} &= 452 \text{ mm} && (\text{measured from drawing}) \\ &= 17.8 \text{ in.} \\ \phi F_{ns(103-204)} &= \phi f_{ce} w_{s(103-204)} b_w && (\text{eq. A-2}) \\ &= 5,876 \text{ k} \\ &= 26,137 \text{ kN} &> & Su = 14,532 \text{ kN} \\ &\text{O.K!}\end{aligned}$$

Based on the checking, the diagonal compression strut width is measured to be 463 mm. The maximum ultimate compression strut force from the analysis is 14,532 kN, which is lower than the calculated capacity of 26,137 kN. Therefore, the diagonal compression strut capacity satisfies the ultimate limit force from the analysis.

#### 7.4. Finite Element Analysis (FEM) for P-11A

The FEM model was based on BD 37/88 3 notional lanes loading criteria for Serviceability Limit State Load Combination 1.

Figure 36. P-11A S11 stress diagram

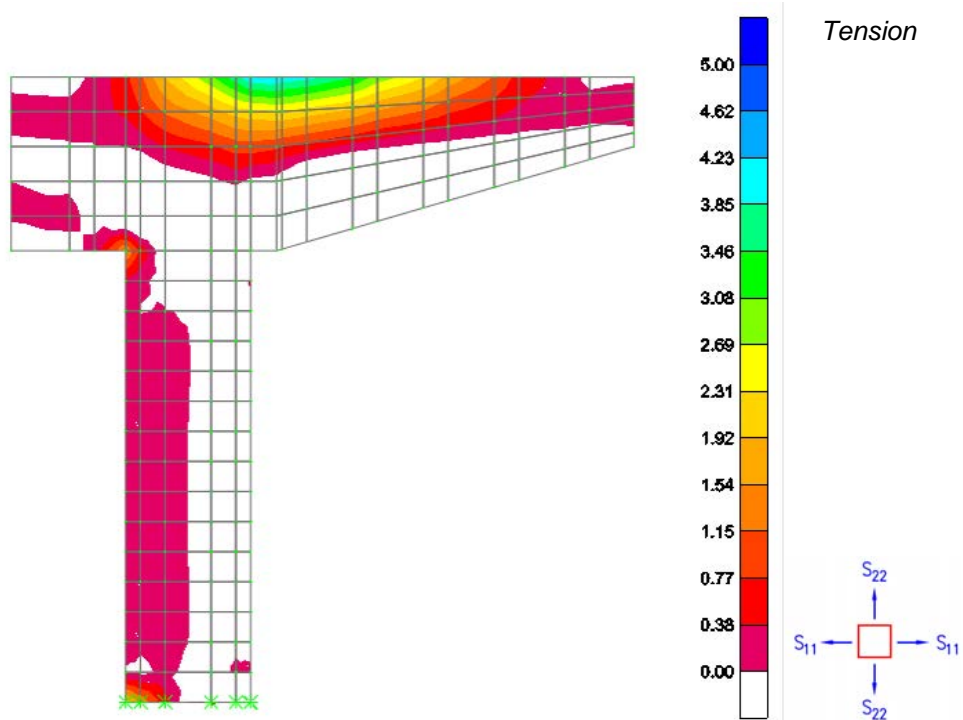

Figure 37. P-11A S11 tension stress diagram

Figure 38. P-11A S22 stress diagram

Figure 39. P-11A S22 tension stress diagram

Figure 40. P-11A SMAX stress diagram

Figure 41. P-11A SMAX tension stress diagram

Figure 42. P-11A SMIN tension stress diagram

Based on Figure 39, it is shown that the S22 tension stress extends approximately 2.0m from the top of the pier into the crosshead. Therefore, it would be suggested that the pier main reinforcement should be extended up for a minimum of 0.8 depth of the crosshead followed by tension anchorage length to cater for tension of the reinforcement bars.

## 7.5. Summary of Design Review for Pier P-11A

- (a) The pier column ultimate capacity (ULS) and crack width (SLS) check is summarized as below.

Table 35. P-11A – Summary of pier ULS moment capacity

Pier Type	Ultimate Moment Capacity (kN.m)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-C (P-11A)	O.K	O.K	O.K

Table 36. P-11A – Summary of pier SLS crack width

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-C (P-11A)	0.416	0.370	0.398

Based on the checking, the existing pier column design satisfied the ULS capacity. However, the crack widths computed are more than 0.250mm which exceeded the SLS criteria.

- (b) The crosshead ultimate moment capacity (ULS) check is summarized as below.

Table 37. P-11A – Summary of crosshead ULS moment capacity

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	24,439	26,069	25,805	1.06
BD 37/88 (2 Notional Lanes)	24,439	26,069	24,442	1.00
JKR MTAL (3 Notional Lanes)	24,439	26,069	25,173	1.03

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The checking shows that the existing design of crosshead did not meet the ULS moment capacity for BD 37/88 (3 Notional Lanes) and JKR MTAL (3 Notional Lanes) loading criteria when analyzed without the side reinforcement. When side reinforcement is taken into consideration, the crosshead moment capacity is adequate for all three (3) loading cases.

(c) The crosshead ultimate shear capacity (ULS) check is summarized as below.

Table 38. P-11A – Summary of crosshead ULS shear capacity

BD 37/88 (3 Notional Lanes) @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.72	8.04	0.96
ULS2C1	7.28	8.04	0.90
ULS3C1	6.96	8.04	0.87
ULS4C1	7.71	8.04	0.96

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

BD 37/88 (2 Notional Lanes) @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	6.90	8.04	0.86
ULS2C1	6.64	8.04	0.83
ULS3C1	6.94	8.04	0.86
ULS4C1	7.70	8.04	0.96

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

JKR MTAL @ 2.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.57	8.04	0.94

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

The checking shows that the existing shear capacity design of the crosshead is adequate at ULS.

(d) The crosshead crack width (SLS) check is summarized as below.

Table 39. P-11A – Summary of crosshead SLS crack width

Crosshead Type	3 Notional Lanes (BD 37/88)	
	Crack Width (mm)	
	Without Sidebar	With Sidebar
P1-C (P-11A)	<b>0.270</b>	<b>0.255</b>

Crosshead Type	2 Notional Lanes (BD 37/88)	
	Crack Width (mm)	
	Without Sidebar	With Sidebar
P1-C (P-11A)	0.196	0.181

Crosshead Type	3 Notional Lanes (JKR MTAL)	
	Crack Width (mm)	
	Without Sidebar	With Sidebar
P1-C (P-11A)	<b>0.252</b>	0.238

The checking shows that the existing design of the crosshead did not meet the SLS crack width criteria of 0.250mm for BD 37/88 (3 Notional Lanes) loading criteria. When BD 37/88 (3 Notional Lanes) loading criteria is checked against the existing design, the calculated crack width satisfies the allowable limit of 0.250mm. However, the crack width calculated under JKR MTAL loading criteria only satisfies the 0.250mm limit criteria when side reinforcement is taken into consideration.

- (e) The following table shows the comparison of ULS design between conventional beam theory and STM.

Table 40. P-11A – Conventional beam theory vs. STM

Element Force	Conventional Beam Theory	STM
Bending Moment, $A_{s_{req'd}}$	2 x 17T32	2 x 15T32
Shear Force, $A_{sv_{req'd}}$	3T16-150	4T16-150

Based on the comparison, it is found that the reinforcement required the resist the bending moment by using STM method is less than the conventional beam theory method. In the other hand, STM design method requires more shear links compared to conventional beam theory design.

- (f) Based on Figure (42), the pier column main vertical reinforcement of T32-150 was terminated near top of crosshead without 90° anchorage bent.

From Figure (31) of the STM analysis, the vertical ultimate tension of 10,685kN on the tension tie member (Node 103 to 203) extends from the bottom compression strut to the top tension tie. Although, the reinforcement provided in the pier column tension zone of 32T32 and 3T16-150 of crosshead links is sufficient to resist the tension tie force, but they don't have sufficient anchorage length into the nodal zone to satisfy STM design philosophy.

Figure 43. P-11A as-built detailing

Moreover, from Figure (38) of the FEM analysis, the crosshead S22 tension stress is found to extend into crosshead about 2.0m from top of pier column (i.e. soffit of crosshead). Therefore, it is essential that the main column reinforcement should extend further up and followed by a bend for another minimum tension anchorage length beyond the tension zone.

- (g) It is found that the conventional method of analysis does not capture the tensile stress in the crosshead as compared to STM or FEM analysis. This is due to the conventional method assumes the crosshead and pier column as frame elements connected at the centroid of the respected elements. Therefore, it is recommended to perform STM and FEM analysis to investigate and capture the behaviour of deep crosshead.

## 8. DESIGN REVIEW FOR PIER P-25 (TYPE P1-A)

From the 3D analysis, the load effects under each load case can be obtained for P-25.

### 8.1. Pier Column Check for Pier P-25

The member forces for pier column are presented below for various load combinations. The design checks for pier column members under ULS and SLS are performed.

#### 8.1.1 Analysis Results for Pier P-25 Column

The maximum design forces at pier column base are tabulated.

##### 8.1.1.1 BD 37/88 (3 Notional Lanes)

### 8.1.2 Sectional Capacity Check (ULS) for P-25 Column

The pier section capacity is calculated based on the following as-built information:-

- Ø3000mm,  $f_{cu}=40\text{MPa}$ , 120-T32

### 8.1.2.1 BD 37/88 (3 Notional Lanes)

#### Ultimate Section Capacity BS5400

##### Design Information:

PIER TYPE P25 (P1 -A) (3 Notional Lanes)

$f_{cu}$ =	40	N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$ =	3.10E+07	kN/m <sup>2</sup>	: Modulus of elasticity of concrete; short term
$f_y$ =	460	N/mm <sup>2</sup>	: Yield strength
$E_s$ =	2.00E+08	kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$Y_{cg}$ =	1500.000	mm	: Centroid of section
$\Sigma A_g$ =	7,017,020	mm <sup>2</sup>	: Area of concrete section
$\Sigma A_s$ =	109,378	mm <sup>2</sup>	: Area of Rebars
$\Sigma A_p$ =	-	mm <sup>2</sup>	: Area of prestressing strand
$A_s/A_g$ =	1.56	%	
$A_p/A_g$ =	0.00	%	
$P_{u,max}$ =	145,983	kN	: $0.4f_{cu}A_g + 0.67f_yA_s$

##### Neutral Axis

Neutral Axis,  $Y_n$ , where  $\Sigma(F_c + F_p + F_s + P_u) = 0$

$\Sigma A_c$ =	6,979,891	mm <sup>2</sup>	: Area of concrete in compression
$F_c$ =	-111,678	kN	: Force on concrete
$F_s$ =	-27,005	kN	: Force on rebars
$F_p$ =	0	kN	: Force on prestressing strands
$Err(x)$ =	1.232E-03		: $Err(Y_n) = \Sigma(F_c + F_s + F_p + P_u)$

**$Y_n$  = 2930.67 mm**

$P_u$ =	138,683	kN	: Ultimate Axial Force (+) compression
$M_u$ =	20,386	kN-m	: Ultimate Bending Capacity

Go

##### P-M Graph

	$P_u/P_{u,max}$	$P_u$	$M_u$
1	0.00	0	47,035
2	0.06	8,668	54,611
3	0.12	17,335	61,058
4	0.18	26,003	66,354
5	0.24	34,671	70,509
6	0.30	43,339	73,430
7	0.36	52,006	74,988
8	0.42	60,674	75,521
9	0.48	69,342	75,102
10	0.53	78,009	73,623
11	0.59	86,677	70,872
12	0.65	95,345	66,744
13	0.71	104,013	61,458
14	0.77	112,680	55,019
15	0.83	121,348	46,900
16	0.89	130,016	36,392
17	0.95	138,683	20,386

##### P-M PLOT

The applied forces lies within the P-M interaction envelopes; hence the existing design of Pier P-25 is adequate at ULS.

### 8.1.3 Crack Width Check (SLS) for P-25 Column

The pier crack width is calculated based on the following parameter;

Ø3000mm,  $f_{cu}=40\text{MPa}$ , 120-T32

#### 8.1.3.1 BD 37/88 (3 Notional Lanes)

TITLE : [Pier P25 Type P1-A SLS1C1 \(3 Notional Lanes\)](#)

CRACK WIDTH DESIGN TO BS5400-4:1990 (AXIAL & FLEXURAL)

\*cl.4.2.2 Crack width check applies only for Load Combination 1

##### Design Parameters

$f_{cu} =$	40	N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c =$	3.10E+07	kN/m <sup>2</sup>	: Short term modulus of elasticity of concrete
$\Phi =$	2.00		: Creep coefficient
$E_{cl} =$	1.55E+07	kN/m <sup>2</sup>	: Long term modulus of elasticity of concrete (allowed for creep effect)
$f_y =$	460	N/mm <sup>2</sup>	: Steel Yield Strength
$E_s =$	2.00E+08	kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$\alpha =$	12.90		: Long term ratio $E_s/E_{cl}$

##### Neutral Axis (Elastic Analysis)

Neutral Axis,  $Y_n = \Sigma(A \cdot Y_i) / \Sigma A$

$\Sigma A_c =$	1,850,932	mm <sup>2</sup>	: Area of concrete
$\Sigma A_s =$	1,245,287	mm <sup>2</sup>	: Transformed area of rebar
$\Sigma A =$	3,096,219	mm <sup>2</sup>	: Gross area
$Err(x) =$	0.0		: $Err(Y_n) = \Sigma(A \cdot Y_i) - Y_n \cdot \Sigma A$
$Y_n =$	931.50	mm	

RE\_ITERATE

##### Crack Width Calculation (BS 5400, cl. 5.8.8.2)

$P_g =$	-15856	kN	: Permanent Axial Force; (-) compression
$M_g =$	0	kN-m	: Permanent moment
$M_q =$	13230	kN-m	: Live load moment
$M_s =$	13230	kN-m	: Applied SLS moment
$h =$	3000	mm	: Overall depth of section
$C_{nom} =$	35	mm	: Nominal concrete clear cover as per BS5400, Part 4 -table (13)
$a_{cr} =$	50	mm	: Distance from the point considered (x,y) to the surface of the nearest rebar
$\epsilon_m =$	5.87E-04		: Average strain at point considered
$\epsilon_o =$	-3.30E-04		: Initial strain due to axial load
$\epsilon_{ctm} =$	0.00E+00		: Strain due to tension stiffening effect
$(1-M_q/M_g) =$	#DIV/0!		

Location		To Nearest Rebar			a <sub>cr</sub> (mm)	$\epsilon_1$	$\epsilon_o$	$\epsilon_{suff.}$	$\epsilon_m$	W <sub>max</sub> (mm)
x (mm)	y = a' (mm)	x <sub>r</sub> (mm)	y <sub>r</sub> (mm)	Ø (mm)						
0	0	0	66	32	50	-0.00041	-3.30E-04	0	-7.44E-04	uncracked
0	0	0	0	0	0	-0.00041	-3.30E-04	0	-7.44E-04	uncracked
0	0	0	0	0	0	-0.00041	-3.30E-04	0	-7.44E-04	uncracked
0	0	0	0	0	0	-0.00041	-3.30E-04	0	-7.44E-04	uncracked
0	0	0	0	0	0	-0.00041	-3.30E-04	0	-7.44E-04	uncracked
0	3000	0	2934	32	50	0.000918	-3.30E-04	0.00E+00	5.87E-04	0.087

The computed crack width for Pier P-25 (Type P1-A) is summarized as follows:-

Table 43. Summary of P-25 SLS crack width check

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-25)	0.087	-	-

Hence, the existing design of Pier P-25 is less than the allowable crack width of 0.25mm.

## 8.2. Crosshead Check for Pier P-25

The member forces of crosshead are presented below for various load combinations. The design checks for crosshead members under ULS and SLS are performed based on the following as-built drawing.

Figure 44. P-25 As-built crosshead reinforcement

### 8.2.1 Analysis Results for Pier P-25 Crosshead

The maximum design forces for crosshead are tabulated.

#### 8.2.1.1 BD 37/88 (3 Notional Lanes)

## 8.2.2 Section Capacity Check (ULS) for Pier P-25 Crosshead

The crosshead is checked for its moment and shear capacity under Ultimate Limit State (ULS)

The crosshead section capacity is calculated based on the following as built information:-

### Crosshead P-25 (Type P1-A)

- Width = 3000mm, Depth = 3500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (3 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

### 8.2.2.1 Ultimate Moment Capacity Check for P-25 Crosshead

The computed crosshead ultimate moment capacity for Pier P-25 (Type P1-A) is computed and compared with the ULS applied moments.

Table 50. Summary of P-25 crosshead ULS moment capacity check

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	59,830	65,605	53,530	0.89

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The applied moment lies within the P-M interaction envelope. Hence the existing crosshead design for P-25 (Type P1-A) is adequate at ULS.

The detailed computations of the sectional moment capacity are presented below.

### 8.2.2.1.1 BD 37/88 (3 Notional Lanes)

\*Without Side Reinforcement

#### Ultimate Section Capacity BS5400

##### Design Information:

CROSSHEAD P25 TYPE P1 -A (WITHOUT SIDEBARS) 3 Notional Lanes

$$f_{cu} = 40 \text{ N/mm}^2$$

$$E_c = 3.10 \times 10^7 \text{ kN/m}^2$$

: Characteristic cube strength at 28 days  
: Modulus of elasticity of concrete; short term

$$f_y = 460 \text{ N/mm}^2$$

$$E_s = 2.00 \times 10^8 \text{ kN/m}^2$$

: Yield strength  
: Modulus of elasticity of rebar

$$Y_{cg} = 1750.000 \text{ mm}$$

$$\Sigma A_g = 10,500,000 \text{ mm}^2$$

$$\Sigma A_s = 54,538 \text{ mm}^2$$

$$\Sigma A_p = - \text{ mm}^2$$

$$A_s/A_g = 0.52 \%$$

$$A_p/A_g = 0.00 \%$$

: Centroid of section  
: Area of concrete section  
: Area of Rebars  
: Area of prestressing strand

$$P_{u,max} = 184,809 \text{ kN}$$

$$: 0.4f_{cu}A_g + 0.67f_yA_s$$

##### Neutral Axis

Neutral Axis,  $Y_n$ , where  $\Sigma(F_c + F_p + F_s + P_u) = 0$

$$\Sigma A_c = 1,075,472 \text{ mm}^2$$

$$F_c = -17,208 \text{ kN}$$

$$F_s = 17,208 \text{ kN}$$

$$F_p = 0 \text{ kN}$$

$$Err(x) = 1.000 \times 10^{-3}$$

: Area of concrete in compression  
: Force on concrete  
: Force on rebars  
: Force on prestressing strands  
:  $Err(Y_n) = \Sigma(F_c + F_s + F_p + P_u)$

$$Y_n = 358.49 \text{ mm}$$

$$P_u = - \text{ kN}$$

$$M_u = 59,830 \text{ kN-m}$$

: Ultimate Axial Force (+) compression  
: Ultimate Bending Capacity

##### P-M Graph

	$P_u/P_{u,max}$	$P_u$	$M_u$

##### P-M PLOT

\* With Side Reinforcement T20-150 (Both Sides)

### Ultimate Section Capacity BS5400

#### Design Information:

CROSSHEAD P25 TYPE P1 -A (WITH SIDEBARS) 3 Notional Lanes

$f_{cu}$ =	40 N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$ =	3.10E+07 kN/m <sup>2</sup>	: Modulus of elasticity of concrete; short term
$f_y$ =	460 N/mm <sup>2</sup>	: Yield strength
$E_s$ =	2.00E+08 kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$Y_{cg}$ =	1750.000 mm	: Centroid of section
$\Sigma A_g$ =	10,500,000 mm <sup>2</sup>	: Area of concrete section
$\Sigma A_s$ =	66,476 mm <sup>2</sup>	: Area of Rebars
$\Sigma A_p$ =	- mm <sup>2</sup>	: Area of prestressing strand
$A_s/A_g$ =	0.63 %	
$A_p/A_g$ =	0.00 %	
$P_{u,max}$ =	188,488 kN	: $0.4f_{cu}A_g + 0.67f_yA_s$

#### Neutral Axis

Neutral Axis,  $Y_n$ , where  $\Sigma(F_c + F_p + F_s + P_u) = 0$

$\Sigma A_c$ =	1,312,843 mm <sup>2</sup>	: Area of concrete in compression
$F_c$ =	-21,005 kN	: Force on concrete
$F_s$ =	21,005 kN	: Force on rebars
$F_p$ =	0 kN	: Force on prestressing strands
$Err(x)$ =	1.025E-03	: $Err(Y_n) = \Sigma(F_c + F_s + F_p + P_u)$

$Y_n$  = 437.61 mm

$P_u$ =	- kN	: Ultimate Axial Force (+) compression
$M_u$ =	65,605 kN-m	: Ultimate Bending Capacity

Go

### 8.2.2.2 Ultimate Shear Capacity Check for P-25 Crosshead

The crosshead ultimate shear link required for Pier P-25 (Type P1-A) is computed and compared to the shear link provided.

Table 51. Summary of P-25 ULS shear force capacity check @ 2.0m depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	8.46	8.04	1.05
ULS2C1	7.19	8.04	0.89
ULS3C1	7.98	8.04	0.99
ULS4C1	8.44	8.04	1.05

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

Table 52. Summary of P-25 ULS shear force capacity check @ 3.5m depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.60	8.04	0.94
ULS2C1	6.57	8.04	0.82
ULS3C1	6.74	8.04	0.84
ULS4C1	7.97	8.04	0.99

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

Based on the checking, it is found that the shear link provided at the 2.0m depth crosshead section is marginally insufficient for load case ULS1C1 (HA+KEL) and ULS4C1 (SV20).

However, the shear link provided at the 3.5m depth crosshead section is sufficient to resist the ultimate shear force for all the load cases.

The detailed computations of the sectional shear capacities are presented as below.

### 8.2.2.1.1 BD 37/88 (3 Notional Lanes)

#### \*ULS1C1 @ 2.0m Depth

Element ID = P-25 Crosshead (ULS1C1 - BD 37/88 3 Notional Lanes) @ 2.0m Depth

$$\begin{aligned} f_{cu} &= 40 & \text{N/mm}^2 \\ f_y &= 460 & \text{N/mm}^2 \\ b &= 3,000 & \text{mm} \\ d &= 1,752 & \text{mm} \end{aligned}$$

$$\begin{aligned} V_{ult} &= 6,590 & \text{kN} \\ v &= 1.25 & \text{N/mm}^2 \end{aligned}$$

Remarks : **O.K**

$$\text{Depth Factor, } \xi_s = 0.731$$

$$\begin{aligned} A_s &= 48,240 & \text{mm}^2 & \quad (3 \text{ layers of } 20\text{T}32) \\ v_c &= 0.72 & \text{N/mm}^2 & \quad \xi_s v_c = 0.52 \\ v &> \xi_s v_c \\ A_{sv}/s_{v, \text{req'd}} &= 8.46 \\ A_{sv}/s_{v, \text{prov}} &= 8.04 & \quad (3\text{T}16-150) \end{aligned}$$

**Not Sufficient!**

#### \*ULS2C1 @ 2.0m Depth

Element ID = P-25 Crosshead (ULS2C1 - BD 37/88 3 Notional Lanes) @ 2.0m Depth

$$\begin{aligned} f_{cu} &= 40 & \text{N/mm}^2 \\ f_y &= 460 & \text{N/mm}^2 \\ b &= 3,000 & \text{mm} \\ d &= 1,752 & \text{mm} \end{aligned}$$

### 8.2.3 Crack Width Check (SLS) for P-25 Crosshead

The crosshead crack width is calculated based on the following parameter;

#### Crosshead P-25 (Type P1-A)

- Width = 3000mm, Depth = 3500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (3 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

The computed crosshead crack width for Pier P-25 (Type P1-A) is summarized as follows:-

Table 53. Summary of P-25 SLS crack width check

Loading Criteria	Crack Width (mm)	
	Without Sidebar	With Sidebar
BD 37/88 (3 Notional Lanes)	0.138	0.115

The computed crack width is 0.138mm without taking into account side reinforcement and 0.115mm with side reinforcement. Hence, the crack width is less than the allowable limit of 0.250mm

### 8.2.3.1 BD 37/88 (3 Notional Lanes)

### 8.3. Summary of Design Review for P-25

(a) The pier ultimate capacity (ULS) and crack width (SLS) check is summarized as below.

Table 54. P-25 - Summary of pier ULS moment capacity

Pier Type	Ultimate Moment Capacity (kN.m)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-25)	O.K	-	-

Table 55. P-25 - Summary of pier SLS crack width

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-25)	0.087	-	-

Based on the checking, the existing pier column design satisfied the ULS and SLS criteria.

(b) The crosshead ultimate moment capacity (ULS) check is summarized as below.

Table 56. P-25 – Summary of crosshead ULS moment capacity

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	59,830	65,605	53,530	0.89

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The checking shows that the existing design of the crosshead satisfies the ULS moment capacity.

(c) The crosshead ultimate shear capacity (ULS) check is summarized as below.

Table 57. P-25 – Summary of crosshead ULS shear capacity @ 2.0m depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	8.46	8.04	1.05
ULS2C1	7.19	8.04	0.89
ULS3C1	7.98	8.04	0.99
ULS4C1	8.44	8.04	1.05

\*Capacity ratio is based on Asv/sv<sub>req'd</sub> / Asv/sv<sub>prov</sub>

Table 58. P-25 – Summary of crosshead ULS shear capacity @ 3.5m depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.60	8.04	0.94
ULS2C1	6.57	8.04	0.82
ULS3C1	6.74	8.04	0.84
ULS4C1	7.97	8.04	0.99

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

The checking shows that the existing shear capacity design at 2.0m crosshead depth section did not fulfill the ULS requirement for load case ULS1C1 (HA+KEL) and ULS4C1 (SV20). In the other hand, the existing shear capacity design at 3.5m crosshead depth section satisfies the ULS criteria.

(d) The crosshead crack width (SLS) check is summarized as below.

Table 59. P-25 – Summary of crosshead SLS crack width

Crosshead Type	3 Notional Lanes (BD 37/88)	
	Crack Width (mm)	
	Without Sidebar	With Sidebar
P1-A (P-25)	0.138	0.115

The checking shows that the existing design of the crosshead satisfies the SLS crack width criteria of 0.250mm.

## 9. DESIGN REVIEW FOR PIER P-33 (TYPE P1-A)

From the 3D analysis, the load effects under each load case can be obtained for P-33.

### 9.1. Pier Column Check for Pier P-33

The member forces for pier column are presented below for various load combinations. The design checks for pier column members under ULS and SLS are performed.

#### 9.1.1 Analysis Results for Pier P-33 Column

The maximum design forces at pier column base are tabulated.

##### 9.1.1.1 BD 37/88 (3 Notional Lanes)

Table 60. P-33 pier force – BD 37/88 (3 Notional Lanes)

No.	Load Case	N (kN)	M (kN.m)	Combination 1		$\gamma_{f3}$ ULS
				$\gamma_{fL}$		
				SLS	ULS	
1	SW	10350	-4	1.00	1.15	1.10

ULS4C1	(SW+Deck Slab+SDL+Premix) + (HA+HB30 2 CARRIAGEWAY)	23929	3206
ULS5C1	(SW+Deck Slab+SDL+Premix) + (HB45)	20167	-14402
ULS6C1	(SW+Deck Slab+SDL+Premix) + (SV20)	22246	-18087

### 9.1.2 Section Capacity Check (ULS) for Pier P-33 Column

The pier section capacity is calculated based on the following parameter;

- Ø3000mm,  $f_{cu}=40\text{MPa}$ , 120-T32

### 9.1.2.1 BD 37/88 (3 Notional Lanes)

#### Ultimate Section Capacity BS5400

##### Design Information:

PIER TYPE P33 (P1 -A) (3 Notional Lanes)

$f_{cu}$ =	40 N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$ =	3.10E+07 kN/m <sup>2</sup>	: Modulus of elasticity of concrete; short term
$f_y$ =	460 N/mm <sup>2</sup>	: Yield strength
$E_s$ =	2.00E+08 kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$Y_{cg}$ =	1500.000 mm	: Centroid of section
$\Sigma A_g$ =	7,017,020 mm <sup>2</sup>	: Area of concrete section
$\Sigma A_s$ =	109,378 mm <sup>2</sup>	: Area of Rebars
$\Sigma A_p$ =	- mm <sup>2</sup>	: Area of prestressing strand
$A_s/A_g$ =	1.56 %	
$A_p/A_g$ =	0.00 %	
$P_{u,max}$ =	145,983 kN	: $0.4f_{cu}A_g + 0.67f_yA_s$

##### Neutral Axis

Neutral Axis,  $Y_n$ , where  $\Sigma(F_c + F_p + F_s + P_u) = 0$

$\Sigma A_c$ =	6,979,891 mm <sup>2</sup>	: Area of concrete in compression
$F_c$ =	-111,678 kN	: Force on concrete
$F_s$ =	-27,005 kN	: Force on rebars
$F_p$ =	0 kN	: Force on prestressing strands
$Err(x)$ =	1.232E-03	: $Err(Y_n) = \Sigma(F_c + F_s + F_p + P_u)$

$Y_n$  = 2930.67 mm

$P_u$ =	138,683 kN	: Ultimate Axial Force (+) compression
$M_u$ =	20,386 kN-m	: Ultimate Bending Capacity

Go

##### P-M Graph

	$P_u/P_{u,lim}$	$P_u$	$M_u$
1	0.00	0	47,035
2	0.06	8,668	54,611
3	0.12	17,335	61,058
4	0.18	26,003	66,354
5	0.24	34,671	70,509
6	0.30	43,339	73,430
7	0.36	52,006	74,988
8	0.42	60,674	75,521
9	0.48	69,342	75,102
10	0.53	78,009	73,623
11	0.59	86,677	70,672
12	0.65	95,345	66,744
13	0.71	104,013	61,458
14	0.77	112,680	55,019
15	0.83	121,348	46,900
16	0.89	130,016	36,392
17	0.95	138,683	20,386

The applied forces lies within the P-M interaction envelopes; hence the existing design of Pier P-11A is adequate at ULS.

### 9.1.3 Crack Width Check (SLS) for Pier P-33 Column

The pier crack width is calculated based on the following parameter;

Ø3000mm,  $f_{cu}=40\text{MPa}$ , 120-T32

#### 9.1.3.1 BD 37/88 (3 Notional Lanes)

TITLE : [Pier P33 Type P1-A SLS1C1 \(3 Notional Lanes\)](#)

CRACK WIDTH DESIGN TO BS5400-4:1990 (AXIAL & FLEXURAL)

\*cl.4.2.2 Crack width check applies only for Load Combination 1

##### Design Parameters

$f_{cu} =$	40	N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c =$	3.10E+07	kN/m <sup>2</sup>	: Short term modulus of elasticity of concrete
$\Phi =$	2.00		: Creep coefficient
$E_{cl} =$	1.55E+07	kN/m <sup>2</sup>	: Long term modulus of elasticity of concrete (allowed for creep effect)
$f_y =$	460	N/mm <sup>2</sup>	: Steel Yield Strength
$E_s =$	2.00E+08	kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$\alpha =$	12.90		: Long term ratio $E_s/E_{cl}$

##### Neutral Axis (Elastic Analysis)

Neutral Axis,  $Y_n = \Sigma(A \cdot Y_i) / \Sigma A$

$\Sigma A_c =$	1,850,932	mm <sup>2</sup>	: Area of concrete
$\Sigma A_s =$	1,245,287	mm <sup>2</sup>	: Transformed area of rebar
$\Sigma A =$	3,096,219	mm <sup>2</sup>	: Gross area
$Err(x) =$	0.0		: $Err(Y_n) = \Sigma(A \cdot Y_i) - Y_n \cdot \Sigma A$
$Y_n =$	931.50	mm	

RE\_ITERATE

##### Crack Width Calculation (BS 5400, cl. 5.8.8.2)

$P_g =$	-13965	kN	: Permanent Axial Force; (-) compression
$M_g =$	9	kN-m	: Permanent moment
$M_q =$	13914	kN-m	: Live load moment
$M_s =$	13923	kN-m	: Applied SLS moment
$h =$	3000	mm	: Overall depth of section
$C_{nom} =$	35	mm	: Nominal concrete clear cover as per BS5400, Part 4 -table (13)
$a_{cr} =$	50	mm	: Distance from the point considered (x,y) to the surface of the nearest rebar
$\epsilon_m =$	6.75E-04		: Average strain at point considered
$\epsilon_o =$	-2.91E-04		: Initial strain due to axial load
$\epsilon_{stm} =$	0.00E+00		: Strain due to tension stiffening effect
$(1-M_q/M_g) =$	-1.55E+03		

Location		To Nearest Rebar			$a_{cr}$ (mm)	$\epsilon_1$	$\epsilon_o$	$\epsilon_{stiff}$	$\epsilon_m$	$W_{max}$ (mm)
$x$ (mm)	$y = a'$ (mm)	$x_r$ (mm)	$y_r$ (mm)	$\phi$ (mm)						
0	0	0	66	32	50	-0.00043	-2.91E-04	0	-7.26E-04	uncracked
0	0	0	0	0	0	-0.00043	-2.91E-04	0	-7.26E-04	uncracked
0	0	0	0	0	0	-0.00043	-2.91E-04	0	-7.26E-04	uncracked
0	0	0	0	0	0	-0.00043	-2.91E-04	0	-7.26E-04	uncracked
0	0	0	0	0	0	-0.00043	-2.91E-04	0	-7.26E-04	uncracked
0	3000	0	2934	32	50	0.000966	-2.91E-04	0.00E+00	6.75E-04	0.100

The computed crack width for Pier P-33 (Type P1-A) is summarized as follows;

Table 62. Summary of P-33 crack width check

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-33)	0.100	-	-

Hence, the existing design of Pier P-33 is less than the allowable crack width of 0.25mm.

## 9.2. Crosshead Check for Pier P-33

The member forces of crosshead are presented below for various load combinations. The design checks for crosshead members under ULS and SLS are performed based on the following as-built drawing.

Figure 45. P-33 As-built crosshead reinforcement

## 9.2.1 Analysis Results for Pier P-33 Crosshead

The maximum design forces for crosshead are tabulated for various cases.

### 9.2.1.1 BD 37/88 (3 Notional Lanes)

## 9.2.2 Section Capacity Check (ULS) for P-33 Crosshead

The crosshead section capacity is calculated based on the following parameter;

### Crosshead P-33 (Type P1-A)

- Width = 3000mm, Depth = 3500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (3 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

### 9.2.2.1 Ultimate Moment Capacity Check for P-33 Crosshead

The computed crosshead ultimate moment capacities for P-33 (Type P1-A) is computed and compared with the ULS applied moments.

Table 69. Summary of P-33 crosshead ULS moment capacity check

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	59,830	65,605	49,396	0.83

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The applied ULS moment is within the P-M interaction envelope. Hence, the existing crosshead moment capacity design for P-33 (Type P1-A) is adequate at ULS.

The detailed computations of the sectional moment capacities are presented below.

### 9.2.2.1.1 BD 37/88 (3 Notional Lanes)

\*Without Side Reinforcement

#### Ultimate Section Capacity BS5400

##### Design Information:

CROSSHEAD P33 TYPE P1 -A (WITHOUT SIDEBARS) 3 Notional Lanes

$f_{cu}$ =	40 N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$ =	3.10E+07 kN/m <sup>2</sup>	: Modulus of elasticity of concrete; short term
$f_y$ =	460 N/mm <sup>2</sup>	: Yield strength
$E_s$ =	2.00E+08 kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$Y_{cg}$ =	1750.000 mm	: Centroid of section
$\Sigma A_g$ =	10,500,000 mm <sup>2</sup>	: Area of concrete section
$\Sigma A_s$ =	54,538 mm <sup>2</sup>	: Area of Rebars

### 9.2.2.2 Ultimate Shear Capacity Check for P-33 Crosshead

The crosshead ultimate shear link required for Pier P-33 (Type P1-A) is computed and compared to the shear link provided.

Table 70. Summary of P-33 ULS shear capacity check @ 2.0m depth

Load Case	$Asv/sv_{req'd}$	$Asv/sv_{prov}$	Capacity Ratio
ULS1C1	7.87	8.04	0.98
ULS2C1	6.58	8.04	0.82
ULS3C1	7.87	8.04	0.98
ULS4C1	7.73	8.04	0.96

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

Table 71. Summary of P-33 ULS shear capacity check @ 3.5m depth

Load Case	$Asv/sv_{req'd}$	$Asv/sv_{prov}$	Capacity Ratio
ULS1C1	7.81	8.04	0.97
ULS2C1	6.66	8.04	0.83
ULS3C1	6.62	8.04	0.82
ULS4C1	7.85	8.04	0.98

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

Based on the checking, the shear link provided is more than required. Hence, the existing crosshead shear design for P-33 (Type P1-A) is adequate at ULS.

The detailed computations of the sectional shear capacities are presented as below.

### 9.2.2.2.1 BD 37/88 (3 Notional Lanes)

#### \*ULS1C1 @ 2.0m Depth

### 9.2.3 Crack Width Check (SLS) for Pier P-33 Crosshead

The crosshead crack width is calculated based on the following parameter;

#### Crosshead P-33 (Type P1-A)

- Width = 3000mm, Depth = 3500mm,  $f_{cu}=40\text{MPa}$
- Top Reinforcement = T32-150 (3 layers)
- Bottom Reinforcement = T20 – 150 (1 layer)

The computed crosshead crack width for Pier P-33 (Type P1-A) is summarized as follows;

Table 72. Summary of P-33 crosshead SLS crack width check

Loading Criteria	Crack Width (mm)	
	Without Sidebar	With Sidebar
BD 37/88 (3 Notional Lanes)	0.130	0.110

The computed crack width is 0.130mm without taking into account side reinforcement and 0.110mm with side reinforcement. Hence, the crack width is less than the allowable limit of 0.250mm

The detailed computation of the crack widths are presented below.

### 9.2.3.1 BD 37/88 (3 Notional Lanes)

#### \* Without Side Reinforcement

TITLE : Crosshead P33 Type P1-A SLS1C1 (WITHOUT SIDEBAR) 3 Notional Lanes

CRACK WIDTH DESIGN TO BS5400-4:1990 (AXIAL & FLEXURAL)

\*cl.4.2.2 Crack width check applies only for Load Combination 1

#### Design Parameters

$f_{cu}$	40 N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$	3.10E+07 kN/m <sup>2</sup>	: Short term modulus of elasticity of concrete
$\Phi$	2.00	: Creep coefficient
$E_{cl}$	1.55E+07 kN/m <sup>2</sup>	: Long term modulus of elasticity of concrete (allowed for creep effect)
$f_y$	460 N/mm <sup>2</sup>	: Steel Yield Strength
$E_s$	2.00E+08 kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$\alpha$	12.90	: Long term ratio $E_s/E_{cl}$

#### Neutral Axis (Elastic Analysis)

Neutral Axis,  $Y_n = \Sigma(A^*Y_i)/\Sigma A$

$\Sigma A_c$	2,865,904 mm <sup>2</sup>	: Area of concrete
$\Sigma A_s$	703,717 mm <sup>2</sup>	: Transformed area of rebar
$\Sigma A$	3,569,621 mm <sup>2</sup>	: Gross area
Err(x)	0.0	: Err(Yn) = $\Sigma(A^*Y_i) - Y_n^* \Sigma A$
Yn	955.30 mm

Figure 46. P-33 STM Analysis Model

Figure 47. P-33 tension and compression zone based on ULS1C1

Figure 48. P-33 STM axial force dDiagram (Blue = Tension, Red = Compression)

The support for the STM model is modeled based on the centroid of the tension reinforcement zone and concrete compression zone as shown in Figure 47.

The tie tension forces obtained from the analysis are checked as follows;

#### Top Tension Tie (109-110) Check

$f_y = 460$  Mpa  
 $A_{s,prov} = 48,240$  mm<sup>2</sup> (3 x 20T32 top reinforcement)

$T_u = 11,541$  kN  
 $A_{s,req} = 28,839$  mm<sup>2</sup>  
 Remarks :  $A_{s,prov} > A_{s,req}$  O.K!

#### Vertical Tension Tie (110-210) Check

$f_y = 460$  Mpa  
 $A_{s,prov} = 48,240$  mm<sup>2</sup> (2x30T32 column main reinforcement - half column zone)  
           16,578 mm<sup>2</sup> (3T16-150 links in 2062mm tension zone)  

---

           64,818 mm<sup>2</sup>

$T_u = 7,157$  kN  
 $A_{s,req} = 17,884$  mm<sup>2</sup>  
 Remarks :  $A_{s,prov} > A_{s,req}$  O.K!

#### Vertical Tension Tie (105-205) Check

$$\begin{array}{rcl} f_y & = & 460 \text{ Mpa} \\ A_{s,prov} & = & 0 \text{ mm}^2 \\ & & 8,040 \text{ mm}^2 \quad (3T16-150 \text{ links in } 1000\text{mm tension zone}) \\ \hline & & 8,040 \text{ mm}^2 \end{array}$$

$$\begin{array}{rcl} T_u & = & 2,945 \text{ kN} \\ A_{s,req} & = & 7,359 \text{ mm}^2 \\ \text{Remarks : } & A_{s,prov} > A_{s,req} & \text{ O.K!} \end{array}$$

The check shows that the reinforcement provided is sufficient to resist the tension tie forces.

The bottom compression strut forces obtained from the analysis are checked as follows;

#### Bottom Compression Strut (208-209) Check

$$\begin{array}{rcl} f_{cu} & = & 40 \text{ Mpa} \\ b & = & 3,000 \text{ mm} \quad (\text{Crosshead width}) \\ d & = & 970 \text{ mm} \quad (\text{Crosshead compression zone}) \\ \\ S_u & = & 13,244 \text{ kN} \\ \sigma & = & 4.55 \text{ Mpa} \\ \text{Remarks : } & < 0.4f_{cu} & \text{ O.K} \end{array}$$

Based on the check, the concrete stress calculated is  $4.55 \text{ N/mm}^2$ , which is less than  $0.4f_{cu}$ ;  $16.0 \text{ N/mm}^2$ . Thus, the bottom strut concrete compression stress is within the strength limit.

The diagonal compression strut is checked as follows;

Figure 49. P-33 diagonal strut check

#### Diagonal Strut <sub>(110-209)</sub> Calculation based on ACI

##### Effective Compressive Strength for Node <sub>110</sub>

$$\begin{aligned}\beta_n &= 0.6 && \text{(CTT)} \\ f'_c &= 40 && \text{Mpa} && \text{(cube strength)} \\ &= 4,640 && \text{psi} \\ f_{c3(110)} &= 0.85\beta_n f'_c && \text{(eq. A-8)} \\ &= 2.37 && \text{ksi} \\ &= 16.32 && \text{Mpa}\end{aligned}$$

##### Calculate Width of Tie <sub>109-110</sub>

$$\begin{aligned}\phi &= 0.85 && \text{(cl. C.9.3.2.6)} \\ b_w &= 3,000 && \text{mm} \\ &= 118.2 && \text{in.} \\ F &= 11,541 && \text{kN} \\ &= 2,594 && \text{k} \\ W_{(109-110)} &= F / \phi(b_w)f_{cu} \\ &= 10.9 && \text{in.} \\ &= 277.2 && \text{mm}\end{aligned}$$

### Effective Compressive Strength for Strut 110-209

$$\begin{aligned}\beta_s &= 1.00 && (\text{cl. A.3.2.1}) \\ f'_c &= 40 \text{ Mpa} && (\text{cube strength}) \\ &= 4,640 \text{ psi} && (\text{cylinder strength})\end{aligned}$$

$$\begin{aligned}f_{ce(110-209)} &= 0.85\beta_s f'_c && (\text{eq. A-3}) \\ &= 3.94 \text{ ksi} \\ &= 27.20 \text{ Mpa}\end{aligned}$$

### Check Strut 110-209 Capacity

$$\begin{aligned}W_{s(110-209)} &= 480.6 \text{ mm} && (\text{measured from drawing}) \\ &= 18.9 \text{ in.}\end{aligned}$$

$$\begin{aligned}\phi F_{ns(110-209)} &= \phi f_{ce} W_{s(110-209)} b_w && (\text{eq. A-2}) \\ &= 7,498 \text{ k} \\ &= 33,349 \text{ kN} &> \quad Su = 9,226 \text{ kN} \\ &\text{O.K!}\end{aligned}$$

Based on the checking, the diagonal compression strut width is measured to be 480.6mm. The maximum ultimate compression strut force from the analysis is 9,226 kN, which is lower than the calculated capacity of 33,349 kN. Therefore, the diagonal compression strut capacity satisfies the ultimate limit force from the analysis.

#### 9.4. Finite Element Analysis (FEM) for P-33

The FEM model was based on BD 37/88 3 notional lanes loading criteria for Serviceability Limit State Load Combination 1.

Figure 52. P-33 S22 stress diagram

Figure 54. P-33 SMAX stress diagram

Figure 55. P-33 SMAX tension stress diagram

## 9.5. Summary of Design Review for P-33

(a) The pier ultimate capacity (ULS) and crack width (SLS) check is summarized as below.

Table 73. P-33 – Summary of pier ULS moment capacity

Pier Type	Ultimate Moment Capacity (kN.m)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-33)	O.K	-	-

Table 74. P-33 Summary of pier SLS crack width

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-A (P-33)	0.100	-	-

Based on the checking, the existing pier column design satisfied the ULS and SLS criteria.

(b) The crosshead ultimate moment capacity (ULS) check is summarized as below.

Table 75. P-33 Summary of crosshead ULS moment capacity

Loading Criteria	Ult. Moment Capacity (kN.m)		Maximum ULS Moment (kN.m)	Capacity Ratio
	Without Sidebar	With Sidebar		
BD 37/88 (3 Notional Lanes)	59,830	65,605	49,396	0.83

\*Capacity ratio is based on Maximum ULS Moment / Ult. Moment Capacity (without sidebar)

The checking shows that the existing design of crosshead satisfies the ULS criteria.

(c) The crosshead ultimate shear capacity (ULS) check is summarized as below.

Table 76. P-33 – Summary of crosshead ULS shear capacity  
BD 37/88 (3 Notional Lanes) @ 2.0m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.87	8.04	0.98
ULS2C1	6.58	8.04	0.82
ULS3C1	7.87	8.04	0.98
ULS4C1	7.73	8.04	0.96

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

BD 37/88 (3 Notional Lanes) @ 3.5m Depth

Load Case	Asv/sv <sub>req'd</sub>	Asv/sv <sub>prov</sub>	Capacity Ratio
ULS1C1	7.81	8.04	0.97
ULS2C1	6.66	8.04	0.83
ULS3C1	6.62	8.04	0.82
ULS4C1	7.85	8.04	0.98

\*Capacity ratio is based on  $Asv/sv_{req'd} / Asv/sv_{prov}$

The checking shows that the existing shear capacity design of the crosshead is adequate at ULS.

(d) The crosshead crack width (SLS) check is summarized as below.

Table 77. P-33 – Summary of crosshead SLS crack width

Crosshead Type	3 Notional Lanes (BD 37/88)	
	Crack Width (mm)	
	Without Sidebar	With Sidebar
P1-A (P-33)	0.130	0.110

The checking shows that the existing design of the crosshead satisfies the SLS criteria of 0.25mm crack width.

- (e) The following table shows the comparison of ULS design between conventional beam theory and STM.

Table 78. P-33 Conventional beam theory vs. STM

Element Force	Conventional Beam Theory	STM
Bending Moment, $A_{s_{req'd}}$	3 x 20T32	2 x 20T32
Shear Force, $A_{sv_{req'd}}$	3T16-150	3T16-150

Based on the comparison, it is found that the reinforcement required the resist the bending moment by using STM method is less than the conventional beam theory method. The required shear link to resist the shear force is found to be similar between STM method and conventional beam theory method.

- (f) Based on Figure (54), the pier column main vertical reinforcement of 2xT32-150 are terminated slightly over the mid depth of the crosshead without 90° anchorage bent.

From Figure (43) & (45) of the STM analysis, the vertical ultimate tension of 7,157kN on the tension tie member (Node 110 to 210) extends from the bottom compression strut to the top tension tie. Although, the reinforcement provided in the pier column tension zone of 2x30T32 and 3T16-150 of crosshead links is sufficient to resist the tension tie force, but they don't have sufficient anchorage length into the nodal zone to satisfy STM design philosophy.

Figure 57. P-33 as-built detailing

Moreover, from Figure (50) of the FEM analysis, the crosshead S22 tension stress is found to extend into crosshead about 2.1m from top of pier column (i.e. soffit of crosshead). Therefore, it is essential that the main column reinforcement should extend up to the top of crosshead and followed by a bend for another minimum tension anchorage length beyond the tension zone.

- (g) It is found that the conventional method of analysis does not capture the tensile stress in the crosshead as compared to STM or FEM analysis. This is due to the conventional method assumes the crosshead and pier column as frame elements connected at the centroid of the respected elements. Therefore, it is recommended to perform STM and FEM analysis to investigate and capture the behaviour of deep crosshead.

## 10. CONCLUSION

A design review has been carried out for the affected Pier P-11A (Type P1-C), P-25 (Type P1-A) and P-33 (Type P1-A). The affected pier and crosshead designs are checked based on the available as built drawings. Three (3) independent analytical models were established based on BD 37/88, JKR SV20 and JKR MTAL traffic live load criteria to determine the maximum induced forces acting on the structures.

The following table summarized the different traffic live load analysis for this study.

Table 79. Summary of traffic live load analysis

Pier Type	BD 37/88		SV20	JKR MTAL (3 Notional Lanes)
	3 Notional Lanes	2 Notional Lanes		
P1-C (P-11A)	√	√	√	√
P1-A (P-25)	√		√	
P1-A (P-33)	√		√	

### 10.1. Pier Column Check

The pier ultimate capacity (ULS) and crack width (SLS) check is summarized as follows:-

Table 80. Summary of pier ULS moment capacity

Pier Type	Ultimate Moment Capacity (kN.m)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-C (P-11A)	O.K	O.K	O.K
P1-A (P-25)	O.K	-	-
P1-A (P-33)	O.K	-	-

Table 81. Summary of pier SLS moment capacity

Pier Type	Crack Width (mm)		
	3 Notional Lanes (BD37/88)	2 Notional Lanes (BD37/88)	3 Notional Lanes (JKR MTAL)
P1-C (P-11A)	0.416	0.370	0.398
P1-A (P-25)	0.087	-	-
P1-A (P-33)	0.100	-	-

The maximum ultimate load acting on the pier columns are within the ultimate capacity of the structure. Therefore, the existing design of the pier columns satisfies the ULS criteria.

The pier column crack width calculated for P-25 and P-33 is less than 0.25mm, which satisfies the SLS criteria. However, the crack widths for P-11A under 3 different load conditions are found to be more than 0.25mm. Hence, the existing design of P-11A doesn't fulfill the SLS criteria.

Hence, remedial work shall be implemented for all inverted "L" shape pier columns in order to enhance the durability of the structure, especially against the corrosion of the main pier column reinforcement.

## 10.2. Crosshead Check

The crosshead ultimate moment capacity (ULS) check is summarized as follows;

Table 82. Summary of crosshead ULS moment capacity

Crosshead Type	Ult Moment Capacity (kN.m)		3 Notional Lanes (BD 37/88)
	Without Sidebar	With Sidebar	Maximum ULS Moment (kN.m)

	Without Sidebar	With Sidebar
P1-C (P-11A)	<b>0.252</b>	0.238
P1-A (P-25)	-	-
P1-A (P-33)	-	-

The maximum ultimate moment acting on P-25 and P-33 crossheads is within the ultimate capacity of the structure. Therefore, the existing design of the piers satisfies the ULS moment capacity criteria. In the other hand, the maximum ultimate moment acting on P-11A crosshead is only satisfactory when side reinforcement is taken into account in the ultimate capacity calculation of the crosshead.

The maximum ultimate shear acting on P-11A and P-33 crossheads is within the ultimate capacity of the structure. Therefore, the existing design of the piers satisfies the ULS moment capacity criteria. In the other hand, the maximum ultimate shear acting on P-25 crosshead exceeded the shear capacity of the crosshead for load case ULS1C1 (HA+KEL) and ULS4C1 (SV20)

P-11A and P-33 STM indicates that sufficient top reinforcement has been provided to resist the crosshead ULS tensile force. The resultant compressive stress at the bottom compression strut is found to be less than the strength limit and the diagonal strut force is calculated to be less than the capacity. The vertical tensile force of P-11A is found to exceed the shear capacity calculated from the existing shear link provided. However, the vertical tensile force of P-33 is within the shear capacity calculated from the existing shear link provided.

Crack widths calculated for P-25 and P-33 crosshead are within the allowable limit of 0.25mm, which satisfies the SLS criteria. The crack width for P-11A only satisfies the allowable limit under BD 37/88 two (2) notional lane criteria. When checked against BD 37/88 three (3) notional lane criteria, the crack width is found to exceed the allowable 0.25mm limit. Under load combination with JKR MTAL, the crack width only satisfies the allowable limit when side reinforcement is considered in the crack width calculation.

## 11. APPENDIX A – CRACK WIDTH VERIFICATION

PROJECT : [Port Klang Bridge Design Audit](#)  
TITLE : [Crack Width Calculation Verification](#)

### CRACK WIDTH DESIGN TO BS5400-4:1990 (AXIAL & FLEXURAL)

\*cl.4.2.2 Crack width check applies only for Load Combination 1

#### Design Parameters

$f_{cu}$ =	40	N/mm <sup>2</sup>	: Characteristic cube strength at 28 days
$E_c$ =	3.10E+07	kN/m <sup>2</sup>	: Short term modulus of elasticity of concrete
$\Phi$ =	2.00		: Creep coefficient
$E_{cl}$ =	1.55E+07	kN/m <sup>2</sup>	: Long term modulus of elasticity of concrete (allowed for creep effect)
$f_y$ =	460	N/mm <sup>2</sup>	: Steel Yield Strength
$E_s$ =	2.00E+08	kN/m <sup>2</sup>	: Modulus of elasticity of rebar
$\alpha$ =	12.90		: Long term ratio $E_s/E_{cl}$

#### Neutral Axis (Elastic Analysis)

Neutral Axis,  $Y_n = \Sigma(A \cdot Y_i) / \Sigma A$

$\Sigma A_c$ =	1,303,899	mm <sup>2</sup>	: Area of concrete
$\Sigma A_s$ =	176,416	mm <sup>2</sup>	: Transformed area of rebar
$\Sigma A$ =	1,480,315	mm <sup>2</sup>	: Gross area
$Err(x)$ =	0.0		: $Err(Y_n) = \Sigma(A \cdot Y_i) - Y_n \cdot \Sigma A$
$Y_n$ =	521.56	mm	

RE\_ITERATE

#### Crack Width Calculation (BS 5400, cl. 5.8.8.2)

$P_g$ =	0	kN	: Permanent Axial Force; (-) compression
$M_g$ =	5000	kN-m	: Permanent moment
$M_q$ =	4000	kN-m	: Live load moment
$M_s$ =	9000	kN-m	: Applied SLS moment
$h$ =	2500	mm	: Overall depth of section
$C_{nom}$ =	35	mm	: Nominal concrete clear cover as per BS5400, Part 4 -table (13)
$a_{cr}$ =	35	mm	: Distance from the point considered (x,y) to the surface of the nearest rebar
$\epsilon_m$ =	1.24E-03		: Average strain at point considered
$\epsilon_o$ =	0.00E+00		: Initial strain due to axial load
$\epsilon_{stiff}$ =	-2.40E-04		: Strain due to tension stiffening effect
$(1-M_q/M_g)$ =	2.00E-01		

Location		To Nearest Rebar								
x (mm)	y = a' (mm)	xr (mm)	yr (mm)	Ø (mm)	a <sub>cr</sub> (mm)	$\epsilon_1$	$\epsilon_o$	$\epsilon_{stiff}$	$\epsilon_m$	$W_{max}$ (mm)

## Crack Width Verification (BS 5400)

### Serviceability Crack Width Calculation

$f_{cu} =$	40	N/mm <sup>2</sup>	Concrete Characteristic Strength
$f_y =$	460	N/mm <sup>2</sup>	Steel Specified Characteristic Strength
$E_s =$	200	kN/mm <sup>2</sup>	Steel Elastic Modulus
$b_t =$	2500	mm	Breadth of Section
$h =$	2500	mm	Depth of Section
$c_{nom} =$	35	mm	Concrete Cover
$\phi =$	32	mm	Bar Diameter
$M_g =$	5000.0	kN.m	Permanent Moment
$M_q =$	4000.0	kN.m	Live Load Moment
$M_s =$	9000.0	kN.m	Applied Service Moment
$d =$	2449	mm	Effective Depth of Tension Reinforcement
$A_s =$	13672	mm <sup>2</sup>	Tension Reinforcement Steel Area
$\alpha_e =$	12.90		Modular ratio
$x =$	521.56	mm	Neutral axis
$a_{cr} =$	35	mm	Dist. to the nearest longitudinal bar
$z =$	2275	mm	Lever arm
$f_s =$	289	N/mm <sup>2</sup>	Steel Stress, $f_s = M_s / (A_s \cdot z)$
$f_c =$	6.07	N/mm <sup>2</sup>	Concrete Stress, $f_c = (f_s \cdot A_s) / (0.5 \cdot b \cdot x)$
$\epsilon_1 =$	1.485E-03		$\epsilon_1 = (f_s / E_s) \cdot ((h-x) / (d-x))$
$3.8b_t h(a'-d_c) =$	4.699E+10		
$\epsilon_s =$	1.447E-03		$\epsilon_s = f_s / E_s$
$\epsilon_s A_s(h-d_c) =$	3.913E+04		
$1-(M_q/M_g) =$	0.200		
$\epsilon_{stiff} = [(3.8b_t h(a'-d_c) / (\epsilon_s A_s(h-d_c))) \cdot ((1-(M_q/M_g)) \cdot 10^{-9})]$			
$=$	2.402E-04		
$\epsilon_m = \epsilon_1 - [(3.8b_t h(a'-d_c) / (\epsilon_s A_s(h-d_c))) \cdot ((1-(M_q/M_g)) \cdot 10^{-9})]$			eq. 25
(but not greater than $\epsilon_1$ )			
$=$	1.245E-03		
$w_{max} = 3a_{cr}\epsilon_m / [1+2(a_{cr}-c_{nom})/(h-d_c)]$			eq. 24
$=$	0.131	mm	

## **12. APPENDIX B – PROPOSED REMEDIAL WORK**

### **12.1. Pier Type P1-C (Inverted “L” Pier)**

#### **12.1.1 Pier Column**

Remedial work using flexible coatings are proposed for inverted pier (Type P1-C) i.e. P-10A, 11A, 12A, 13B, 14B and 15B (Total 6 nos.) to fulfil the Serviceability Limit State (SLS) requirement.

Base on the as-built information, there are 17 nos. of inverted “L” for the existing elevated bridge. Namely,

7A, 8A, 9A, 10A, 11A, 12A, 13A, 14A (8 nos.)

8B, 9B, 10B, 11B, 12B, 13B, 14B, 15B, 16B (9 nos.)

In order to prevent deterioration of structure due to ingress of water and rebar corrosion due to the excessive design crack widths, some flexible coatings shall be used. All cracks to be sealed and apply two coats of polymer-modified cementitious waterproofing coating (SIKA Top Seal 109 MY) which has good crack bridging capacity up to 1.0mm. This flexible coating shall have the ability to accommodate the future cracks induced. However, it has limited life span.

#### **12.1.2 Crosshead**

Carbon fibre plate is proposed to strengthen the region where the main pier column reinforcement anchorage length into the crosshead is insufficient. A combination of (3 x 3 x 3 layers) + (3 x 3 x 3 layers) + (3 x 3 x 3 layers) Sika CarboDur S1012 is to be applied on each side of the crosshead. The detailed calculation for the proposed strengthening work is shown as below.

Figure 58. FRP Strengthening for Crosshead Type P1-C (Anchorage)

### Crosshead Anchorage using Sika CarboDur Plate S1012

Width = 100 mm  
 Thickness = 1.2 mm  
 $\phi$  Tensile = 0.60  
 Min. Tensile Strength = 2,800 MPa

$T_U = 10,685$  kN

$A_{s,req} = 6,360$  mm<sup>2</sup>  
 = 53 strips

$A_{s,prov} = \underline{54}$  strips

The optimal bond length for the plate is calculated based on “Guide for the Design and Construction of Externally Bonded FRP Systems for Strengthening Existing Structures” published by the National Research Council advisory committee on technical recommendations for constructions, 2004.

Figure 59. Optimal bond length,  $l_e$

$$\begin{aligned}
 E_f &= 165,000 \text{ MPa} && \text{(Young modulus of elasticity)} \\
 t_f &= 3 \times 1.2 \text{ mm} \\
 f_{ctm} &= 2.0 \text{ MPa} && \text{(average tensile strength of concrete)} \\
 l_e &= [(E_f \cdot t_f) / (2 \cdot f_{ctm})]^{0.5} \\
 &= \underline{385} \text{ mm}
 \end{aligned}$$

Based on Figure 39, it is shown that tensile stress **S22** extends up to approximately 0.8 depth of the crosshead. This resulted in approximately 2000mm depth of tensile zone and 500mm depth of compression zone. Therefore, the calculated 385mm bond length is sufficiently bonded in the 500mm compression zone. The average tensile strength of concrete is to be verified by Tensile Pull Off Test on site.

6 layers of carbon fibre wrap using SikaWrap – 231C are introduced at the top of pier where the bottom of carbon fibre plate is anchored to resist the tensile force resulting from the carbon fibre plate.

Figure 60. Carbon Fibre Wrap Type P1-C

$T_u =$	10,685	kN	
$T_u/2 =$	5,343	kN	
Spread angle =	45	degrees	
$H =$	5,343	kN	
Tensile Strength =	4,900	N/mm <sup>2</sup>	
Thk =	0.127	mm	
$T_u =$	420	kN/m	(Recommended by SIKA)
Width of Wrapping =	1.25	m	
No. of Layer Required =	<u>5.09</u>		(Use 6 layers)

### Crosshead Anchorage using Sika CarboDur Plate S1012

$$\begin{aligned}\text{Width} &= 100 \text{ mm} \\ \text{Thickness} &= 1.2 \text{ mm} \\ \phi \text{ Tensile} &= 0.60 \\ \text{Min. Tensile Strength} &= 2,800 \text{ MPa}\end{aligned}$$

$$T_U = 7,157 \text{ kN}$$

$$\begin{aligned}A_{s,\text{req}} &= 4,260 \text{ mm}^2 \\ &= \underline{\underline{36}} \text{ strips}\end{aligned}$$

$$A_{s,\text{prov}} = \underline{\underline{36}} \text{ strips}$$

The optimal bond length for the plate is calculated based on “Guide for the Design and Construction of Externally Bonded FRP Systems for Strengthening Existing Structures” published by the National Research Council advisory committee on technical recommendations for constructions, 2004.

Figure 62. Optimal bond length,  $l_e$

$$\begin{aligned}E_f &= 165,000 \text{ MPa} && \text{(Young modulus of elasticity)} \\ t_f &= 2 \times 1.2 \text{ mm} \\ f_{ctm} &= 2.0 \text{ MPa} && \text{(average tensile strength of concrete)}\end{aligned}$$

$$\begin{aligned}l_e &= [(E_f \cdot t_f) / (2 \cdot f_{ctm})]^{0.5} \\ &= \underline{\underline{315}} \text{ mm}\end{aligned}$$

Based on Figure 53, it is shown that tensile stress S22 extends up to approximately 0.6 depth of the crosshead. This resulted in approximately 2100mm depth of tensile zone and 1400mm depth of compression zone. Therefore, the calculated 315mm bond length is sufficiently bonded in the 1400mm compression zone. The average tensile strength of concrete is to be verified by Tensile Pull Off Test on site.

4 layers of carbon fibre wrap using SikaWrap – 231C are introduced at the top of pier where the bottom of carbon fibre plate is anchored to resist the tensile force resulting from the carbon fibre plate.

Figure 63. Carbon Fibre Wrap Type P1-A

$$\begin{aligned}
 T_u &= 7,157 \text{ kN} \\
 T_u/2 &= 3578.5 \text{ kN} \\
 \text{Spread angle} &= 45 \text{ degrees} \\
 H &= 3578.5 \text{ kN} \\
 \\ 
 \text{Tensile Strength} &= 4,900 \text{ N/mm}^2 \\
 \text{Thk} &= 0.127 \text{ mm} \\
 T_u &= 420 \text{ kN/m} \quad (\text{Recommended by SIKA}) \\
 \text{Width of Wrapping} &= 1.5 \text{ m} \\
 \text{No. of Layer Required} &= \underline{2.84} \quad (\text{Use 4 layers})
 \end{aligned}$$

For the shear strengthening at crosshead depth of 2.0m, nine (9) strips of Sika CarboDur S1012 at 500mm spacing is proposed at each face of the crosshead. The detailed calculation for the proposed strengthening work is shown as below.

Figure 64. FRP Strengthening for Crosshead Type P1-A (Shear)

### Crosshead Shear Strengthening using Sika CarboDur Plate S1012

$f_{cu}$	=	40	MPa	(28 days concrete cube compressive strength)
$f'_c$	=	32	MPa	(28 days concrete cylinder compressive strength)
$f_y$	=	460	MPa	(yield strength of shear steel)
$b_w$	=	3000	mm	(width of beam)
$h$	=	2000	mm	(depth of beam)
$d$	=	1854	mm	(distance to flexural steel)
$h_c$	=	1044.7	mm	(distance from tension face to neutral axis)
$A_s$	=	48240	mm <sup>2</sup>	(area of flexural steel)
$A_v$	=	1206	mm <sup>2</sup>	(area of shear steel)
$V_U$	=	6590	kN	(ultimate shear force)
$V_U$	=	6275	kN	(ultimate shear capacity)

### Strengthening of the section (Using modified USD approach)

$$\begin{aligned} \text{Required } \phi_L V_L &= V_U - \phi_c V_c - \phi_s V_s \\ &= 315.0 \quad \text{kN} \end{aligned}$$

Product = Sika CarboDur S1012

$$\theta = 45 \quad \text{degrees to shear crack}$$

$E_t$	=	165000	MPa	
$F_{tu}$	=	2800	MPa	
$t_L$	=	1.2	mm	
$\epsilon_L$	=	0.004	mm/mm	
$s_L$	=	500	mm	
$b_L$	=	100	mm	(width of laminate strip)
$L_b$	=	100	mm	(effective bond length of each FRP anchorage areas; lesser of the length of FRP reinforcing that extends into the compression zone of beam and 100mm)

Required nominal shear strength

$$\phi_L V_L = 315.0 \text{ kN}$$

Check Nominal Shear Strength based on Concrete Bond Strength

$$\phi_{Lc} = 0.5$$

$$\begin{aligned} V_b &= 0.91(f'_c)^{0.5} \\ &= 5.15 \text{ MPa} \end{aligned}$$

$$\begin{aligned} A_b &= h_c \cot \theta L_b \quad (\text{for wrap}) \\ &= 104470 \text{ mm}^2 \end{aligned}$$

$$\begin{aligned} A_b &= (b_L/s_L) h_c \cot \theta L_b \quad (\text{for laminate strips}) \\ &= 20894 \text{ mm}^2 \end{aligned}$$

$$\begin{aligned} \phi_{Lc} V_L &= \phi_{Lc} 2 V_b A_b \quad (2.3.3) \\ &= 537.8 \text{ kN} > 315.0 \text{ kN} \quad \text{O.K} \end{aligned}$$

Check Nominal Shear Strength based on Tensile Strength

$$\phi_L = 0.45$$

$$\begin{aligned} \phi_L V_L &= \phi_L 2 f_{Lu} t_L h_c \cot \theta \quad (\text{for wrap}) \quad (2.3.4) \\ &= 3159.2 \text{ kN} > 315.0 \text{ kN} \quad \text{O.K} \end{aligned}$$

$$\phi_L = 0.6$$

$$\begin{aligned} \phi_L V_L &= \phi_L 2 f_{Lu} t_L (b_L/s_L) h_c \cot \theta \quad (\text{for laminate strips}) \quad (2.3.5) \\ &= 842.4 \text{ kN} > 315.0 \text{ kN} \quad \text{O.K} \end{aligned}$$

Check Nominal Shear Strength based on Shear Strength of Sidakur Epoxy

$$\phi_{La} = 0.40$$

$$f_{fa} = 24.80 \text{ MPa} \quad (\text{ultimate shear strength of epoxy resin adhesive})$$

$$\begin{aligned} \phi_{La} V_L &= \phi_{La} 2 A_b f_{fa} \quad (2.3.6) \\ &= 2072.7 \text{ kN} > 315.0 \text{ kN} \quad \text{O.K} \end{aligned}$$

## **PRODUCT DATA SHEET AND RELEVANT INFORMATION**
